

Dear Friends and Colleagues,

With regards to booster vaccination against COVID-19, there is no current evidence that in general patients with Gaucher Disease (GD) have a worse outcome from Covid or difference in immune response to vaccination and therefore we would recommend following the local guidelines. However, the IWGGD would be very interested in understanding members data collection and experience which provides further evidence for recommendation in GD.

Kind regards,

Yours sincerely,

Derralynn Hughes

Chair IWGGD
